QUESTIONS TO HAND IN - EXPERIMENT 4
NAME
LAB INSTRUCTOR LAB DAY/TIME $\qquad$

1. If a body is not moving at all, what would a plot of acceleration vs. time look like?
2. If a body is moving at a constant velocity, what would a plot of acceleration vs. time look like?
3. If a person's speed away from the detector smoothly changes from a value of $0 \mathrm{~m} / \mathrm{s}$ to $5 \mathrm{~m} / \mathrm{s}$ in an elapsed time of 3 s , what is the average acceleration?
4. If a person's speed toward the detector smoothly changes from a value of $0 \mathrm{~m} / \mathrm{s}$ to $5 \mathrm{~m} / \mathrm{s}$ in an elapsed time of 3 s , what is the average acceleration?
5. A person performs the following motions over a total span of 15 s : She starts from rest and moves away from the detector for 5 s , when she reaches a speed of $2 \mathrm{~m} / \mathrm{s}$. She then slows down to $0 \mathrm{~m} / \mathrm{s}$ by the end of the next 5 s , and then heads back toward the detector increasing her speed to $1 \mathrm{~m} / \mathrm{s}$ by the end of the next 5 s . What is the average acceleration over the:
(a) first 5 s interval?
(b) second 5 s interval?
(c) the third 5 s interval?
(d) the total 15 s interval?
